

exchange4linux server

Linux based Workgroupserver for data-exchange via MS Outlook™

The exchange4linux server suite is a LINUX-based, powerful e-mail & workgroup server. The exchange4linux features can be used with Microsoft Outlook™. Here you find all components, like e-mail, calendar, todo, addresses and notes, in one package. The server provides you with an unlimited number of mailboxes for usage with the IMAP protocol. For the special workgroup-features you need the N&H Outlook Connector (MAPI Client) for each desktop with Microsoft Outlook™.

With the exchange4linux server suite, all users can share calendar-, todo-, addresses- and notes- folders in the public area on the exchange4linux server. You can also attach workgroupdata to your email-folder on the server. This way, you develop a flexible and varied workgroup-solution, that fits to the demands of your company.

The exchange4linux server suite is very easy to handle. With only a few mouse-clicks you can add new e-mail-users. The administration is completely browser-based and can be done from every PC in the local network or via VPN from everywhere.

Every exchange4linux user gets his own set of personal folders for mail, calendar, todos, notes and contacts. In the "public folder" area you can share centralized addresses, calendars, todos and notes with other users. In this public area you can set special permissions for each user like "visible", "read", "write".

For standard e-mail user (IMAP) and internet-surfers you need no special client-licence. The additional e-mail-server can be used with all mail-programms via POP3/IMAP and the integrated webmail. The webmail-feature is perfect for users who travel a lot.

The exchange4linux server suite is a secure and rock-solid platform for e-mail- and workgroup-applications. With the remote support/update features, the server can be easily enhanced with new functions. The exchange4linux server suite is available as software and as ready-to-run appliance-box-solution.
